Fiber reinforced polymer (FRP) composites have been used for nearly 30 years in aerospace and manufacturing applications where low weight, high tensile strength, and noncorrosive structural properties are required. In civil engineering applications, FRP has proven itself for over 20 years in fabric roof structures, internal concrete reinforcement, deck gratings, and most of all as externally bonded reinforcement.

**MasterBrace® Composite Strengthening Systems**

Fiber reinforced polymer (FRP) composites have been used for nearly 30 years in aerospace and manufacturing applications where low weight, high tensile strength, and noncorrosive structural properties are required. In civil engineering applications, FRP has proven itself for over 20 years in fabric roof structures, internal concrete reinforcement, deck gratings, and most of all as externally bonded reinforcement.

**FRP Materials**

FRP Materials have proven successful in many civil engineering applications because of their light weight, high tensile strength, and low creep. Despite being much thinner than steel, FRP materials can have as much as 10 times the tensile strength of steel. The MasterBrace Composite Strengthening System, an externally bonded FRP reinforcement system used primarily for concrete and masonry structures, utilizes these material properties to provide superior solutions to a wide variety of structural applications.

**Typical Uses**

- Upgrade load bearing capacities of concrete and masonry structures
- Increase bending strength of concrete beams, slabs, and walls
- Increase shear strength of concrete beams and walls
- Improve the capacity of concrete silos, pipes, and tunnels
- Restore capacity of concrete structures lost due to deterioration
- Replace reinforcing steel lost to corrosion
- Replace damaged post-tensioning tendons
- Provide confinement to concrete columns and piers
- Correct design/construction errors
- Replace missing reinforcing steel

**Seismic Retrofit**

- Improve strength and ductility of concrete columns
- Prevent brittle shear failures of concrete beams and walls

**Fabrics**

The MasterBrace fabric system is “cast-in-place” from its two primary components: fiber and polymer. The fiber is delivered to the site in the form of dry, flexible fabrics which are formed around the structure and saturated with uncured epoxy, the polymer component. As the epoxy cures, a rigid FRP composite is formed that shapes itself to the structure and monolithically bonds to the substrate via the epoxy resin. This technique, known as wet lay-up, provides flexibility, constructibility, and short installation times. The result: lower labor costs and less downtime.

**Laminates**

MasterBrace Laminates are prefabricated carbon fiber reinforced epoxy strips. The laminates are bonded to the substrate using approved Master Builders Solutions epoxy adhesives. The MasterBrace LAM 50/1.4CFS and MasterBrace LAM 100/1.4CFS laminates are surface bonded to provide positive and negative bending (flexural) strength as well as shear strengthening applications.

- Fast and easy installation
- Durable
- Light weight
- High-strength to weight ratio
- NSM Information
Master Brace advantages include high strength with high stiffness, lightweight, highly durable, non-corrosive and low-install times.
Advantages and Installation

The MasterBrace Composite Strengthening System is installed by trained, qualified applicators. Although the installation process will vary depending on the specifics of the project, there are a number of common steps that are followed.

MasterBrace FIB 300/50CFS and 600/50CFS
High Strength Carbon Fiber
Dry fabrics constructed of very high strength, aerospace grade carbon fibers. These fabrics are applied onto the surface of existing structural members in buildings, bridges, and other structures using the MasterBrace family of performance polymers.
- Very high strength and stiffness
- Excellent moisture and chemical resistance
- Highly resistant to fatigue and creep rupture

MasterBrace Fabric System Components

**MasterBrace P3500 (Primer)**  
Low viscosity to penetrate concrete pore structure

**MasterBrace F2000 (Putty)**  
High viscosity epoxy paste for surface leveling

**MasterBrace SAT 4500 (Saturant)**  
Low sag epoxy for encapsulating the fibers

**MasterBrace Fiber Reinforcements**  
Carbon, E-Glass, and Aramid fiber fabrics

**MasterBrace SAT 4700 (Saturant)**  
Low temperature, has accelerator for applications down to 35°F

---

**Installation**

Repair any large areas of spalled, delaminated, or otherwise deteriorated areas of the concrete substrate and inject any existing cracks in the substrate greater than 10 mils. Profile the concrete surface by abrasive blasting, water blasting, or disc grinding.

Once the resin cures, the final result is a solid fiber reinforced polymer (FRP) laminate that is bonded to the surface of the structure. The system generally achieves initial cure within 12 hours (depending on ambient temperatures).

1. Apply MasterBrace P3500 using a 3/8” nap roller.

2. Apply MasterBrace F2000 using a trowel or putty knife to level uneven surfaces.

3. Apply a first layer of MasterBrace SAT 4500 or 4700 using a 3/8” nap roller.

4. Cut the dry fiber fabric into the proper width and length using shears or a utility knife.

5. Set the dry fiber fabric into wet saturant and press to the surface using a rib (defoaming) roller. Apply a second layer of saturant to fully encapsulate fibers. Repeat saturant/fiber/saturant layers as needed.

6. Apply topcoat if required.
American Concrete Institute (ACI) recommends the use of FRP systems for strengthening concrete. ACI 440.2R-08 is a comprehensive document which provides guidelines for the design, construction and quality control aspects of using FRP systems.

**Applications**

**Flexural Strengthening**
MasterBrace reinforcement may be used to supplement the bending strength of beams, slabs, walls, and other flexural elements. The bending capacity of reinforced, prestressed, and post-tensioned members can be increased by up to 70%. In these applications, the MasterBrace system is installed along the length of the member similar to longitudinal steel reinforcement.

MasterBrace can be applied to concrete and masonry walls to increase their resistance to out-of-plane loads. This includes loads due to wind, soil pressure, fluid pressure in tanks, and blast loading. In negative moment regions, the reinforcement may be placed on the top of the member for increased capacity. The thin profile of the installed MasterBrace system allows for carpet, tile, and other flooring finishes to be installed over the system without any significant change in floor elevation.

One of the distinct advantages of using MasterBrace reinforcement on slabs is the ability to easily run reinforcement in multiple directions for two-way slabs. Due to the thin profile of the MasterBrace fabrics, no special detailing is required at the intersection of two strips of reinforcement. The lightweight, flexible nature of the MasterBrace system allows overhead installations on beam and slab soffits to be simple, cost-effective, and much safer than using traditional strengthening techniques.

**Shear Strengthening**
MasterBrace reinforcement may be used to increase the shear capacity of concrete beams, columns, and other members. The shear capacity of members can be increased as much as two kips per inch of beam depth and significant increases in ductility can be achieved. In this application, the MasterBrace reinforcement is oriented transversely, similar to steel stirrups, ties or hoops.

MasterBrace shear strengthening can be applied to beams, walls, slabs and columns exposed to shear loading. It may be installed in discrete strips or as a continuous plate. When moisture in the concrete is a concern or possibility, discretely spaced strips should be used to avoid moisture entrapment.

Completely wrapping a member provides the greatest gains in shear strength, however the presence of slabs, walls or other obstructions may make this not feasible. In these cases, the MasterBrace is installed in a “U-Wrap” configuration, wrapping only the sides and bottom. Though not as efficient as completely wrapping a member, an additional 2 kips per inch of beam depth can be expected.

**Confinement**
When confined with external FRP reinforcement, ductility of concrete columns and piers is dramatically improved. Moderate increases in the compressive load carrying capacity can be realized using FRP confinement, but more notably the ductility index can be increased 3 – 4 times. This allows concrete structures to be retrofitted for improved displacement ductility in seismic events. FRP confinement can also be used to clamp existing lap splices in columns — a common problem in seismic regions where tension splices are needed but only compression splices are provided.

**Other Applications**
MasterBrace reinforcement is extremely versatile and can be used as external strengthening nearly anywhere additional reinforcement is required.
- Blast mitigation for concrete and masonry walls
- Strengthening for pressure in pipes, silos, and tanks
- Reinforce around slab and wall openings
- Strengthening domes, tunnels, and chimneys
**MasterBrace Reinforcement Selection Guide**

### Committed to Excellence

The MasterBrace system comes with the industry’s most complete support. Everything needed for a successful installation of MasterBrace is here: specification, design support, contractor training and more. Through a dedicated staff of engineers and sales teams, the MasterBrace composite strengthening system is a comprehensive approach to bringing innovative strengthening technology to the construction industry.

### Value and Design Support

The MasterBrace system offers an alternative to steel plate bonding, section enlargement with concrete or external post tensioning. MasterBrace can meet complex repair challenges cost effectively, while delivering easy application, versatility and long-term performance. Software for strengthening shear and flexural members is also available.

Master Builders Solutions from BASF

The Master Builders Solutions brand brings all of BASF’s expertise together to create chemical solutions for new construction, maintenance, repair and renovation of structures. Master Builders Solutions is built on the experience gained from more than a century in the construction industry.

The know-how and experience of a global community of BASF construction experts form the core of Master Builders Solutions. We combine the right elements from our portfolio to solve your specific construction challenges. We collaborate across areas of expertise and regions and draw on the experience gained from countless construction projects worldwide. We leverage global BASF technologies, as well as our in-depth knowledge of local building needs, to develop innovations that help make you more successful and drive sustainable construction. The comprehensive portfolio under the Master Builders Solutions brand encompasses concrete admixtures, cement additives, chemical solutions for underground construction, waterproofing solutions, sealants, concrete repair and protection solutions, performance grouts and performance flooring solutions.

Master Builders Solutions products from BASF for the Construction Industry:

**MasterAir®**
Solutions for air-entrained concrete

**MasterBrace®**
Solutions for concrete strengthening

**MasterCast®**
Solutions for manufactured concrete product industry

**MasterCem®**
Solutions for cement manufacture

**MasterEmaco®**
Solutions for concrete repair

**MasterFinish®**
Solutions for formwork treatment

**MasterFlow®**
Solutions for precision grouting

**MasterFiber®**
Comprehensive solutions for fiber reinforced concrete

**MasterGlenium®**
Solutions for high-performance concrete

**MasterInject®**
Solutions for concrete injection

**MasterKure®**
Solutions for concrete curing

**MasterLife®**
Solutions for enhanced durability

**MasterMatrix®**
Advanced rheology control solutions for self-consolidating concrete

**MasterPel®**
Solutions for water tight concrete

**MasterPolyheed®**
Solutions for high-performance concrete

**MasterPozzolith®**
Solutions for water-reduced concrete

**MasterProtect®**
Solutions for concrete protection

**MasterRheobuild®**
Solutions for super-plasticized concrete

**MasterRoc®**
Solutions for underground construction

**MasterSeal®**
Solutions for waterproofing and sealing

**MasterSet®**
Solutions for retardation control

**MasterSure®**
Solutions for workability control

**MasterTop®**
Solutions for industrial and commercial floors

**Ucrete®**
Flooring solutions for harsh environments
